

# MS Excel Cell References Types

---

## **Lab**

Create an Excel formula to calculate the total revenue for a store where:

- The price of a single item is in cell **A1**.
- The number of items sold is in **B1 to B5** (different quantities for different products).

Use **absolute, relative, and mixed cell references** appropriately in your formula.

---

### **Example Setup in Excel:**

	<b>A</b>	<b>B</b>	<b>C</b>
1	Price	Sold	Revenue
2	10	5	
3		8	
4		3	
5		6	
6		4	

### **Task:**

1. Write a formula in **C2** to calculate the revenue for each row using the price in **A1**.
2. Ensure that the formula can be dragged down to calculate the revenue for all rows without manually editing it.
